Data viz in R

Was the Premier League ever the strongest league in Europe?

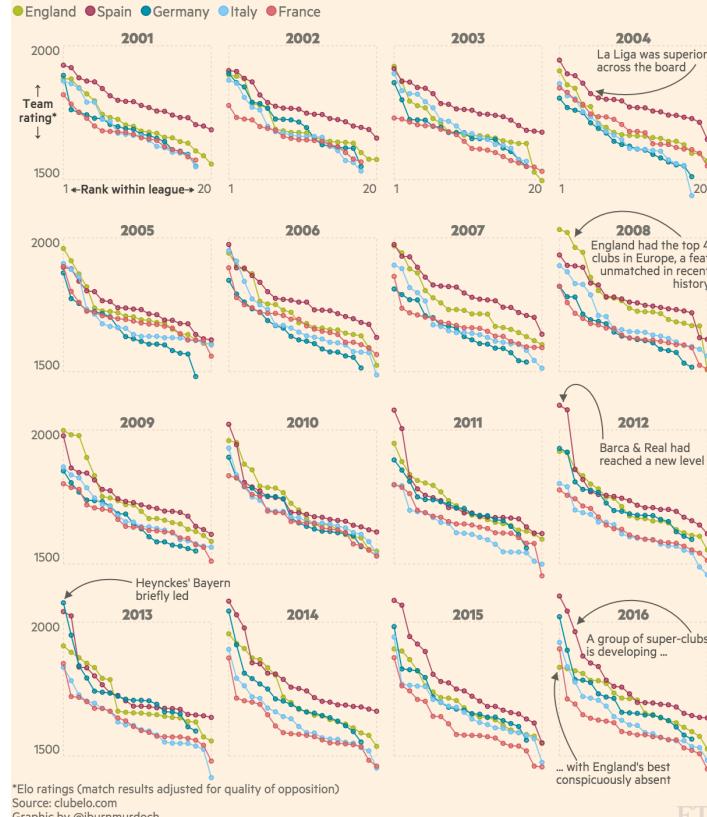

Fans of the English game will point to 2008 & '09, but even then only the very top English sides were stronger than their Spanish counterparts. Today La Liga clubs are stronger from top to bottom

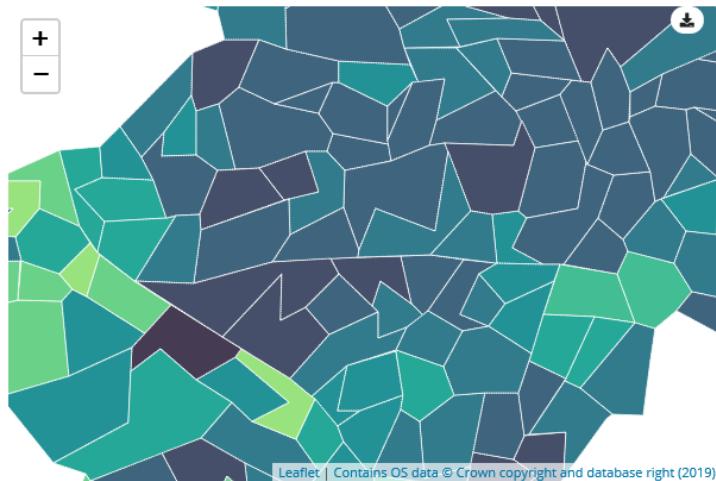

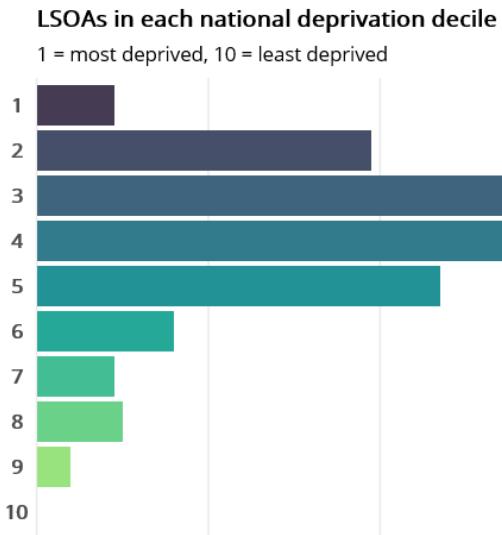

The changing tides of European footballing power

For all the talk of the Premier League being "The Best League in the World™", it's 8 years since its clubs last dominated. Spain's elite & Bayern now lead an elite group, with the English notably absent

Each string of dots represents the clubs in a given country's top league

Do different images have more retweets?

Tweets with no photo or with a custody image as photo have fewer median retweets than those with a regular (non-custody) photo. Having multiple photos does not seem to get more retweets.

In all cases, missing persons who are white have higher median retweets.

Common thread?

Common thread?

ggplot2

- ggplot2 is a package for creating graphics in R based on the **grammar of graphics**.
- A fundamental component of this is that graphics are made up **layers**.
- This way of thinking is reflected in how we write ggplot2 code.

ggplot2

df1		
var1	var2	var3
5	7	AA
3	2	AA
7	9	AA
9	15	BB
12	17	BB

ggplot2

df1		
var1	var2	var3
5	7	AA
3	2	AA
7	9	AA
9	15	BB
12	17	BB

What is the relationship between var1 and var2?

ggplot2: data

Image source: [Skill Gaze](#)

ggplot2: data

```
ggplot(data = df1)
```

df1		
var1	var2	var3
5	7	AA
3	2	AA
7	9	AA
9	15	BB
12	17	BB

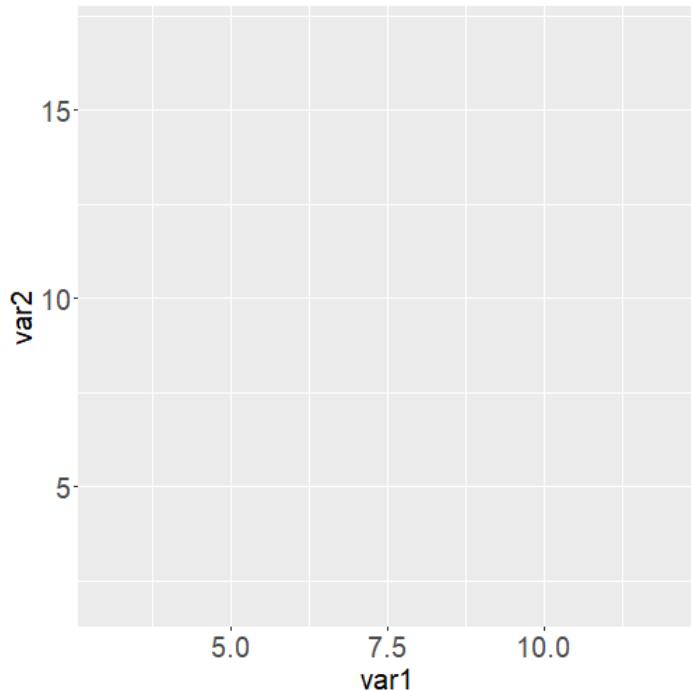

ggplot2: aesthetics

Image source: [Skill Gaze](#)

ggplot2: aesthetics

```
ggplot(data = df1, mapping = aes(x = var1, y = var2))
```

df1		
var1	var2	var3
5	7	AA
3	2	AA
7	9	AA
9	15	BB
12	17	BB

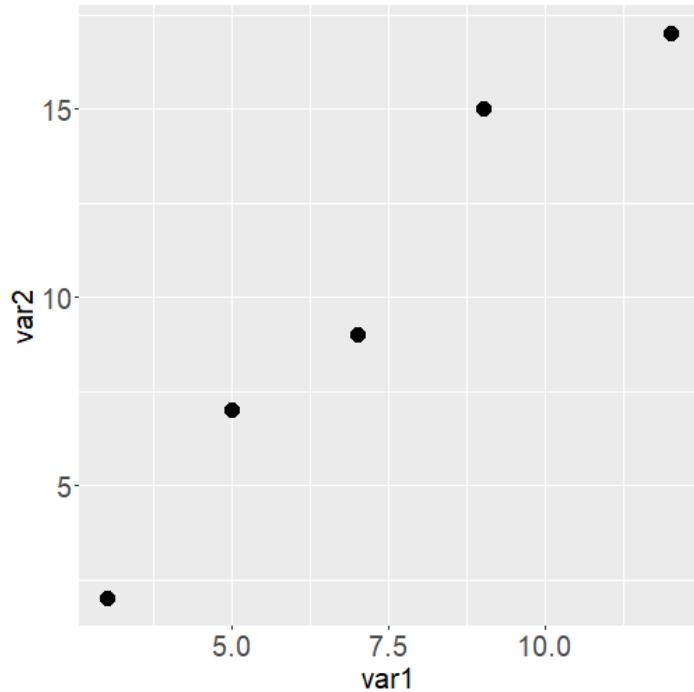

ggplot2: geometries

Image source: [Skill Gaze](#)

ggplot2: geometries

```
ggplot(data = df1, mapping = aes(x = var1, y = var2)) +  
  geom_point()
```

df1		
var1	var2	var3
5	7	AA
3	2	AA
7	9	AA
9	15	BB
12	17	BB

ggplot2: different aesthetics

df1		
var1	var2	var3
5	7	AA
3	2	AA
7	9	AA
9	15	BB
12	17	BB

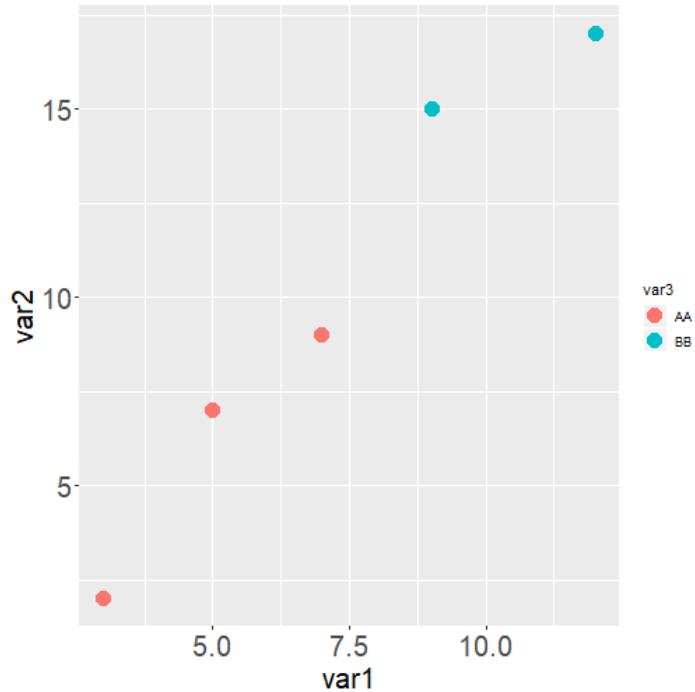

How does var3 factor into this relationship?

ggplot2: different aesthetics

- x
- y
- colour
- shape
- size
- alpha
- linetype
- ...

ggplot2: different aesthetics

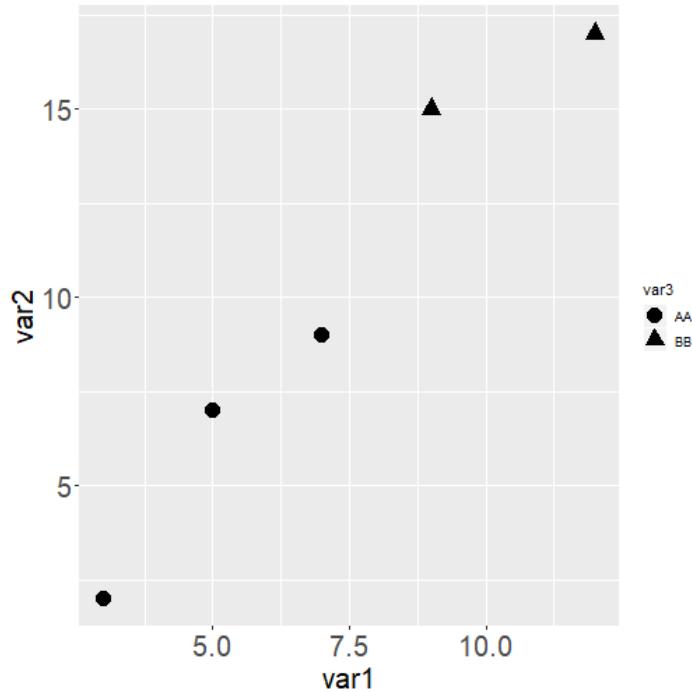

```
ggplot(data = df1, mapping = aes(x = var1, y = var2, colour = var3)) +  
  geom_point()
```

df1		
var1	var2	var3
5	7	AA
3	2	AA
7	9	AA
9	15	BB
12	17	BB

ggplot2: different aesthetics

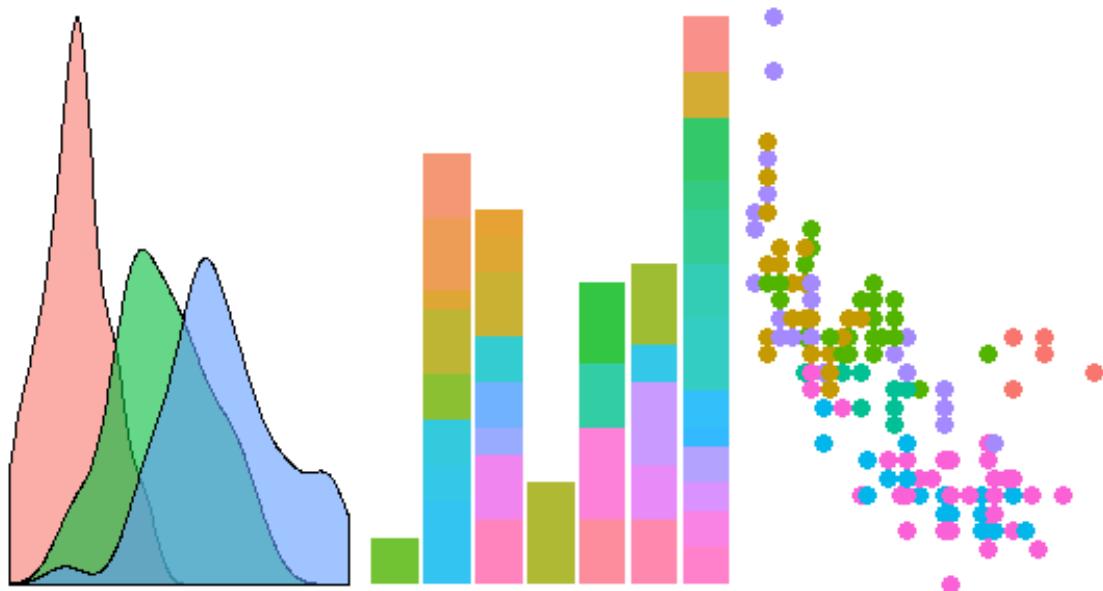

```
ggplot(data = df1, mapping = aes(x = var1, y = var2, shape = var3)) +  
  geom_point()
```

df1		
var1	var2	var3
5	7	AA
3	2	AA
7	9	AA
9	15	BB
12	17	BB

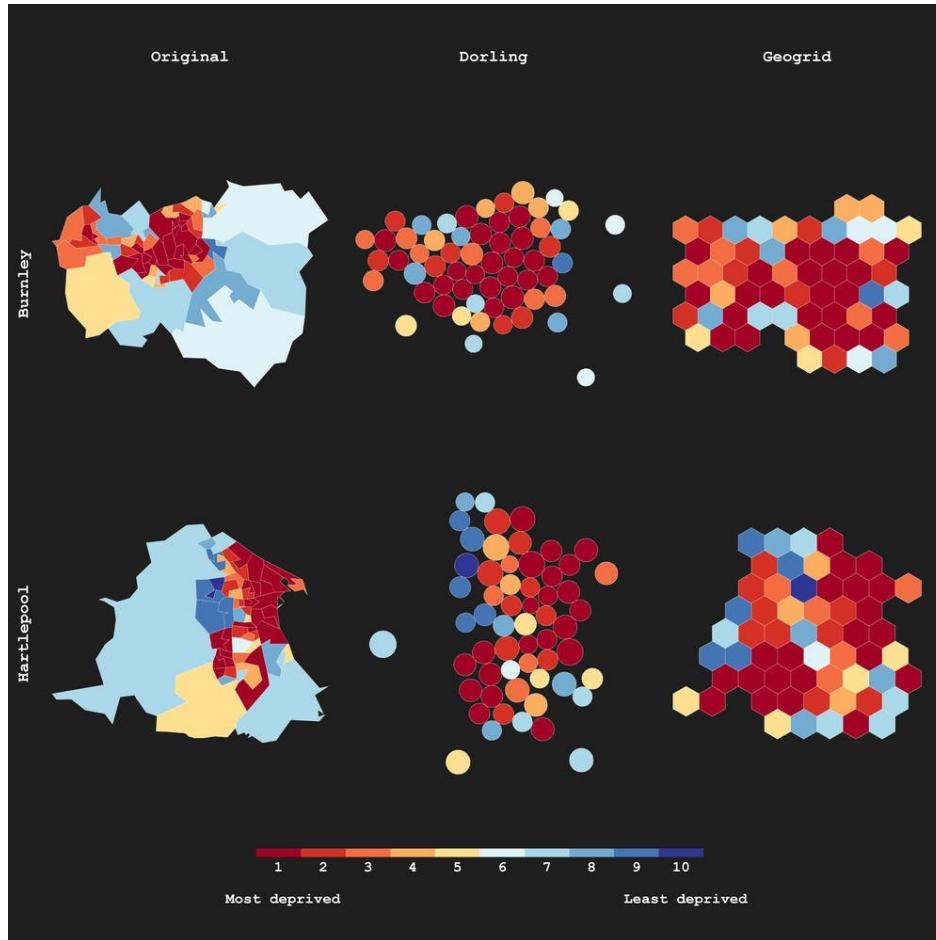

ggplot2: different geometries

- geom_point()
- geom_bar()
- geom_density()
- geom_smooth()
- ...

Maps in R

Source: [The Conversation](#)

The good news...

- Making a map in R is *very similar* to what we have covered already.
- Using `ggplot2` to create beautiful maps is fairly straightforward, making use of an additional package `sf`.

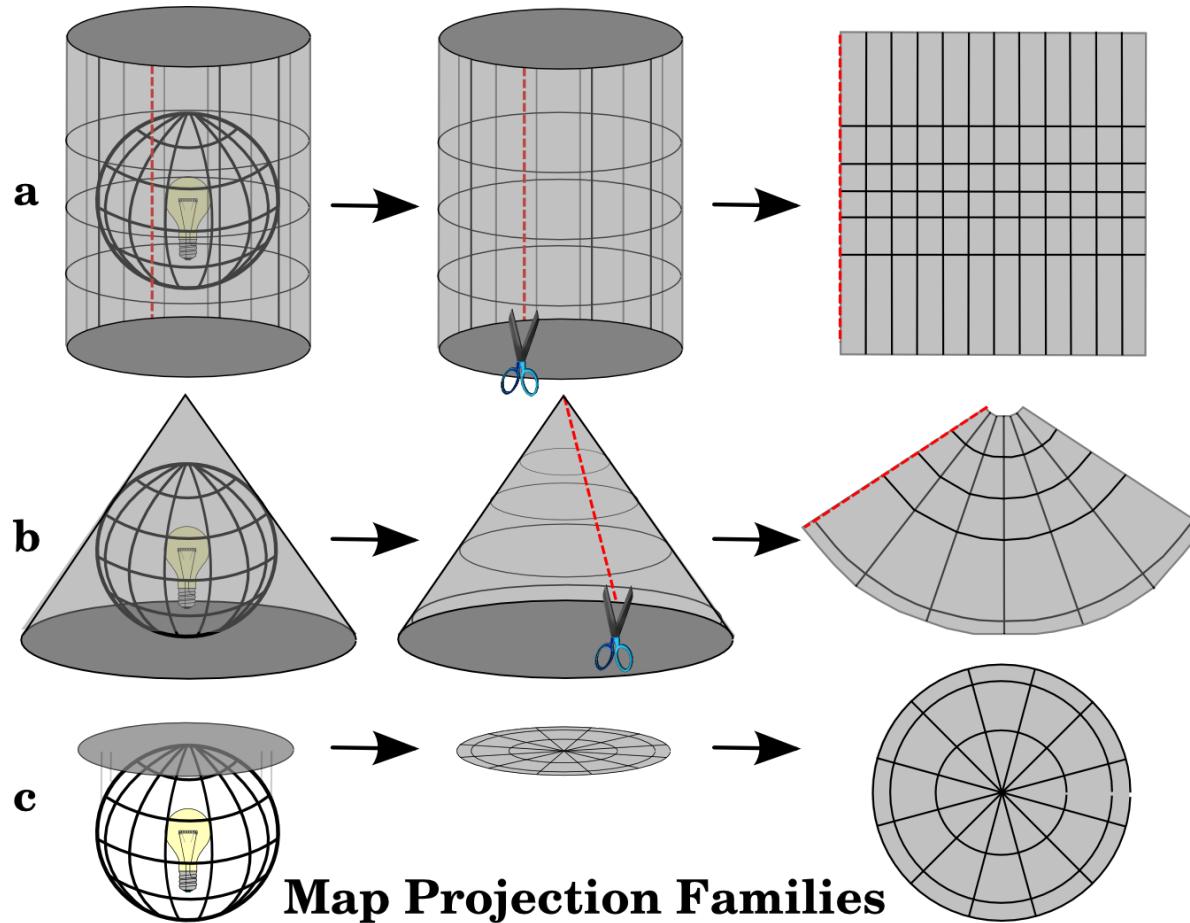

The bad news...

- You might be entering uncharted territory!
- Spatial visualisation necessitates some additional level of understanding in geography and Geographic Information Systems (GIS), including:
 - Spatial data
 - Projection
 - Visualisation issues

The bad news: spatial data

- Today, we will use shapefiles (`.shp`).
- Shapefiles are a popular format to store geospatial vector data.
- Unlike standard 2D data frames, such as `.csv` files, shapefiles contains multiple components.
 - `.shp`
 - `.shx`
 - `.dbf`
 - `.prj`
- But there are other formats, such as `.geojson` or `kml`, which you might come across.
- There is some **debate** over the most appropriate, with each having their own advantages and disadvantages.

The bad news: projections

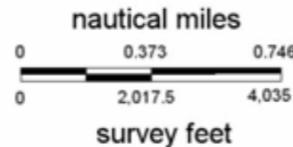

Source: QGIS.

The bad news: visualisation issues

Ten tips to make your maps more ‘interesting’

Tip 1: Do not include a scale bar

This will make it much more interesting as your map readers have to guess the distance between objects. One of the main purposes of mapping crime is to compare areas and examine the proximity of objects, so why make it easy for the uninitiated to understand your map? Without a scale bar nobody will have a clue how far things are apart and this gives you the opportunity to have impromptu quizzes or make things up as you are presenting. If you accidentally include a scale bar use a scale that goes; "0 ----- 6.75 ----- 13.25 kilometers" instead of the usual "0 ---5 ---10" or similar. Big complex numbers really impress audiences, and you want to look your most clever.
